

On a way to delivery automatization

API:

- Projects and environments
- Genesis Accounts
- Generate Iroha credentials
- GenesisBlock

Rational

This design is useful for test environments and production.
Difference is that in test environments we generate iroha credentials, when in production network participants gave us only public keys

Support your project and environment just by implementation of simple interface

```

interface GenesisInterface {

    fun getProject(): String
    fun getEnvironment(): String

    fun getAccountsNeeded(): List<AccountPrototype>

    fun createGenesisBlock(accounts:List<IrohaAccountDto>,
                           peers:List<Peer>,
                           blockVersion:String = "1"): String
}
  
```
